Description

Powerful and accurate, this well rounded swing strategy buys local bottoms for bigger trades. And gives regular signals in strong uptrending markets. Strategy aims for one to multi-day positions yielding bigger profits. Combines trailing stop-loss with 'sell on strategy' to get the most out of each trade. Designed to work well with DCA, but is also proprofitable with stop-loss. More trades with more volatility, usually a few signals per week per coin when downtrending, daily signals when uptrending. Very well-geared to pick up local dumps and pumps to turn quick & nice profits.

Goal & when to deploy

All-round strategy that does not need a lot of supervision. However, best not to deploy in a macro-bear market when using DCA.
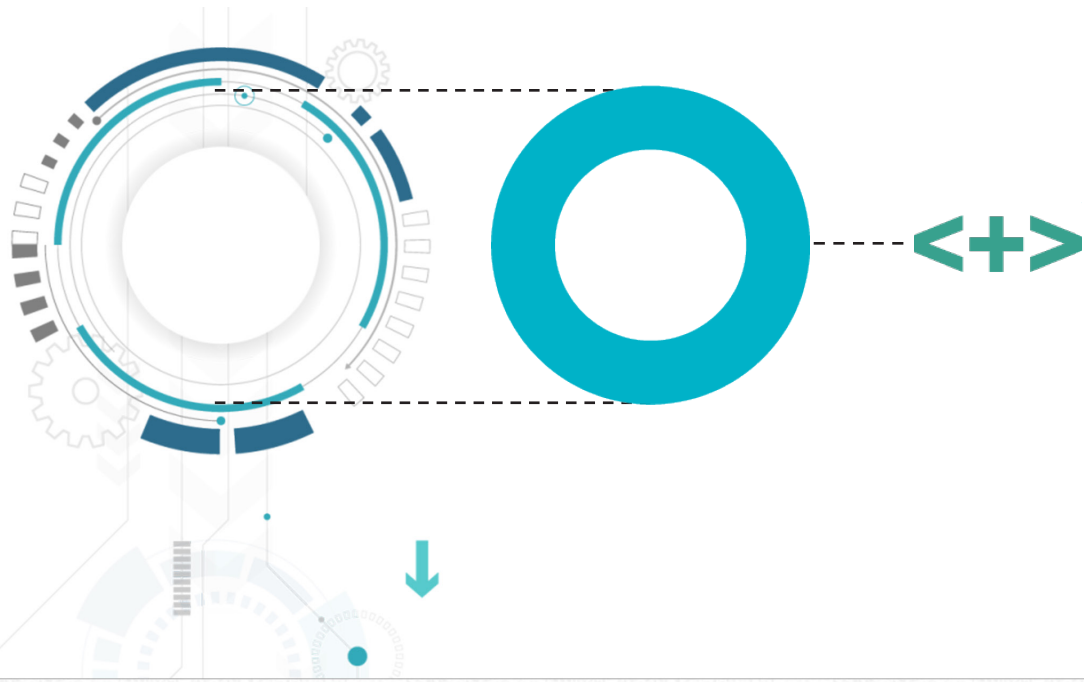

Coins

All spot-market coins.

Base currencies

USDT, USDC, EUR, USD, DAI, BUSD, BTC

Exchanges

E.g. momentum, increase in buying pressure or volume

Triggers

Uptick in price or volume

Confirmation

E.g. momentum, volume

<-> Signal structure [Sells]

Condition(s) indicators

Breaking with trend or support, or weakening of trend.

Signal indicators

E.g. momentum, decrease in buying pressure or volume, resistance bounce

Triggers

Downtick in price or volume

Confirmation (optional)

E.g. momentum, volume

Gainscrypt strategies are built with carefully selected indicators with a layered approach. Of course, we can't share the secret sauce. However, we can lift a tip of the veil by describing how the strategies are schematically laid out.

Selected indicators are clustered together, with each serving a specific role across multiple timeframes.

A. The first cluster of indicators measures if overall trend, strenght & volatility are safe enough to make a trade.

B. The second cluster will signal a potential imminent entry. This may be a shift in momentum, buying pressure, increase of volume or the presence of an ongoing uptrend.

C. The actual buy signal will then be defined by an uptick on a small timeframe to ensure maximum precision upon entry. The signal will flash long enough for the bot to respond.

D. Depening on the trading style, the algorithm will then look for additional confirmations, comparable to cluster B.

Sell signals have a comparable structure. However, the difficulty to sell will vary per strategy. For example, targeted scalping will have stricter entries and slightly easier exits as it aims for smaller profits. Conversely, an accumulation strategy will only sell at macro tops.

How this strategy works

[BTC]

Bearish trend on the daily timeframe

Bullish trend on the daily timeframe

Weak trend, Not buying

Attempted trend-reversal signal

Increased signals when closing in on bottom;

Increased signals at confirmed trend

Strategy exploits volatility

Stop-loss optional. Looser stop-loss or DCA would have avoided unnecessary losses in this case.

Signal at trend reversal, DCA opportunity.

As the template has a percentage buy amount of 1.5% per trade with max. 40 positions. Disregarding DCA positions, your liquidity maintain approx. 33% in an uptrend. These funds can of course also be used for trading to increase trade activity, in which case a separate config pool with stop-loss is recommended. (Not in this testing period)

Paper trade uses default settings for the Wave Gainer Template, but selection of coins has been topped up to 75 during this test.

Real performance might deviate slightly as transaction fees are not taken into account. Example, if your transaction fee of your exchange is 0.1%, then rougly deduct 0.2% from the entire trade from the avere profits. In this case this would be 3.97%.

General

ALWAYS be wary when marketplace sellers show results and especially when there are NO results. Always perform a couple of backtests yourself to confirm that the results align with the sellers claims to see if it checks out - yes, this also counts for Gainscrypt strategies.

Paper trading

Paper trading tends to give a more realistic indication of profitability. Although this may take some time, it is recommended as you will get familiar with the strategy and will get a clearer picture when it buys and sells, frequency and real-life stats. Bear in mind however that real results might still deviate due to transaction fees, slippage or unfilled orders.

Risk-reward ratio

When judging the winrate% of a strategy, always put it into context. Determine the ratio between stop-loss (SL) and take profit (TP) or trailing stop-loss (TSL). If for example an impressive looking winrate is 90%, but the test used TP at 1% and stop-loss at -10%, then it will take 10 good trades to compensate for 1 bad trade. In this example, a **90% winrate is therefore still a net-loss.**

In most cases, Gainscrypt uses a risk/reward of approx. 1:1 or a slightly bigger reward. Then 1 good trade rougly equals 1 bad trade. This way, a 70% winrate is profitable.

In some cases, when a backtest is shown without a stop-loss it will give a 100% accuracy which of course is not the case. Then this means in reality there might be **losing** unclosed positions. For an accumulation or bottom-buyer strategy it may make sense not to use a stop-loss (also in back-test), but not for a more agressive short-term focused scalp strategy.

Dollar Cost Averaging (DCA) and stop-loss

For some larger time-frame strategies (e.g. accumulation or swingtrade strategies) it can be beneficial to use Dollar Cost Averaging. DCA means doubling (or more) a losing position to reduce the average buying price. However, be cautious! Generally recommended to only use DCA for top-projects *or* when given coin is in a clear uptrend. Also, be aware of which strategies you combine with DCA. A scalping strategy for example is typically not designed for DCA. For simplicity's sake, Gainscrypt usually present tests with stop-losses to reveal actual accuracy of the signal.

The advantage of stop-loss is a clear risk containment. The disadvantage is that a premature buy signal that would have been profitable might get knocked out by a stop-loss because of a volatile downswing. Therefore some strategies contain indicators that avoid buying into overly volatile markets. Ofcourse, setting a wider stop-loss might increase your winrate, but also negatively impacts your Risk-reward ratio.
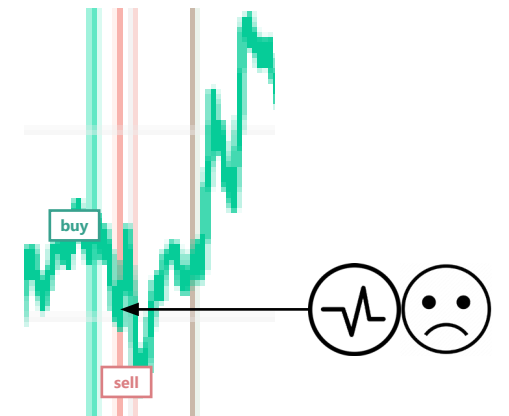

Cool-down & max positions

Strategies may flash signals multiple times in a shorter timeframe. If your config has a cool-down or has a max. positions per coin, then this does not mean there are multiple trades. In most cases, the first signal is the actual signal that your hopper acts upon. This may lead to a higher or lower winrate%. Although the winrate is still an indication - double check this.

Successful sells: 79 (76.70 %)

Sells with loss: 24 (23.30 %)

Average holding time: 8 hour(s)

This should be read as 1 trade, not multiple!

DCA versus stop-loss

Although DCA may seem appealing, this tool has to be used with caution. It is designed to reduce the average buy-in price when a position is at a loss. The advantage is that DCA can iron-out market inefficiency with a safety trade, such as a momentarily drop in an otherwise healthy uptrend. However, the risk is that in strong downtrending markets you keep buying into a losing position. This will increase the size of the losing position and eventually turn you in a long-term holder. This is more in the 'investing' spectrum than 'trading'. It might work well for top-coins like BTC, ETH or projects you're comfortable holding for a longer time, but not very wise to use for your next sh*itcoin. Seriously, if you bought at a blow-off top a position can keep going down to below -90%, even with DCA. And lets be honest; you can't expect a scalp signal designed for a +3% profit then to clear your position with profit.. can you? In addition it will block your liquidity to take on new trades.

So, best only use DCA with top-projects you're fundementally familiar with OR are very confident about a strong uptrend. You can do this by creating config pools which each manage risk in a separate way.

Make no mistake - some crypto's can see a blow-off top which will never repeat and devaluate -99%. Unless you're prepared to 20x your position, you can't be saved with DCA. Be wary of marketplace sellers who tell you to DCA deep into everything and 'be patient until the markets go up'. - this will cost you sooner or later.
Holding time & liquidity

Liquidity in trading means the funds you have available to take on new trades. If you are 100% in positions, this means there is no more liquidity. A low holding time is always favourable as it allows you to make multiple trades within the same timeframe (high liquidity). Swing trading strategies are relatively more accurate and profitable in backtesting, this does not mean it per se beats scalping strategies as scalping - if done well can compound gains faster and is generally geared better for rough market conditions. Can't decide which strategy best fits your style or market conditions? Set up config pools and run multiple strategies! This way you can choose where you apply DCA or stop-loss.
